

The latest technology available from new engine development.

It keeps the same performance at a smaller size by improving the filtration material and its construction.

Constitution of HAMP Oil Filters

Body:
Anti-corrosion paint

Relif Valve : It keeps oil circulation by adjusting the oil flow when the element is stuffed, or when the engine was turned on under ultra low temperatures.

Element : Using high performance element which effectively catches corpuscle like dust and carbon particles.

Drain Back Valve:
Heat-resistant silicone rubber which prevents countercurrent oil when the engine stops, and because of this, oil starts circulating quicker upon re-start of the engine.

Seal Plate : It avoid from looseness by strict measure examination

It made by gasket with anti-heat/oil/low temperature
